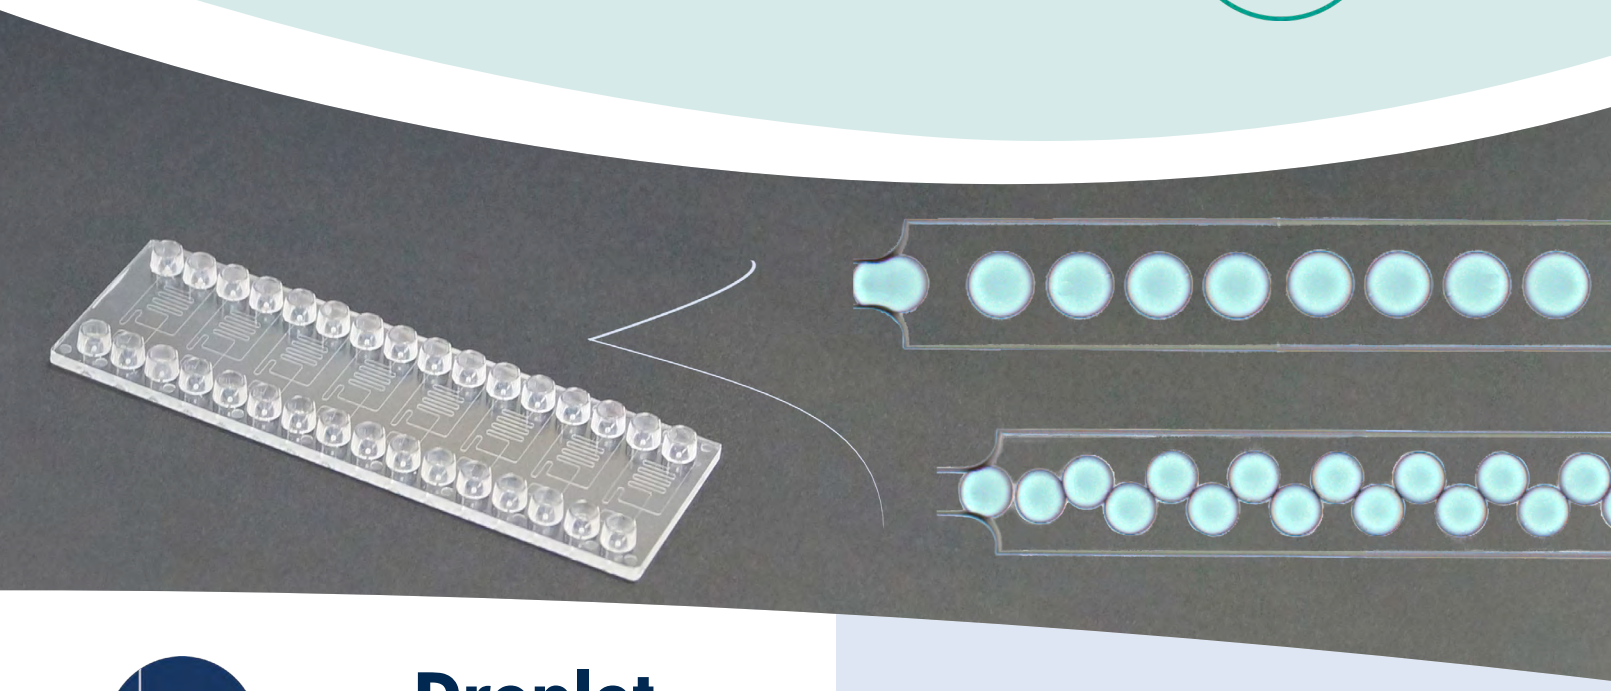
microfluidic ChipShop



Droplet Generation

Explore droplet-based microfluidic solutions

High-throughput generation of monodisperse droplets in the femto- to nanoliter scale has opened up unlimited experimental possibilities. From digital PCR and single cell experiments to particle synthesis, droplet generators have found their way into laboratories.

Find out what *microfluidic ChipShop* has to offer to help you in successfully setting up your droplet generation experiment.

Droplet Generators

- Wide selection of chip designs and channel dimensions available off-the-shelf
- Available nozzle sizes: 10 µm - 140 µm
- Multi-function chips: Droplet generation with storage unit

Pump Setups

- Pressure-driven pump and syringe pump setups, both ensuring high monodispersity & superior flow rate control are available at *microfluidic ChipShop*
- Order a complete pump setup including flow controller, flow units, software and accessories to kick-start your droplet-based experiments

Droplet Generation Kit

- Everything one needs for a successful droplet experiment
- Including accessories and droplet oil suitable for digital PCR and droplet-based cell culture

Custom Designs

- *microfluidic ChipShop* offers manufacturing services to realize your personal design

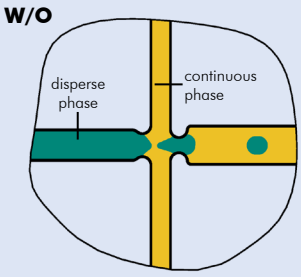
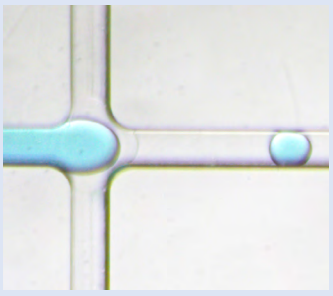
Droplet Generation in a Nutshell

One of the fields in which microfluidics has produced innovative solutions is **droplet-based microfluidics.** The ability to generate a large number of droplets of very uniform size has led researchers to many new applications. By compartmentalizing a biological sample, e.g. droplet-based or so-called digital PCR became possible. Other applications comprise the generation of extremely well-defined emulsions, the synthesis of nanoparticles or the encapsulation of single cells. As the droplet volume can be very small, concentrations of e.g. cell metabolites quickly increase and can be easily analyzed. Droplet motion in the microchannel induces streaming, which allows for a rapid mixing of reagents contained in the droplets. Since the droplet contents never come into contact with the microchannel walls, there is no contamination or carry-over from one droplet to another.

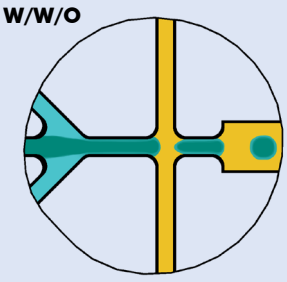
For droplet generation a defined microfluidic channel-cross design, also called nozzle, is required. At the nozzle two immiscible phases, the dispersed phase and the continuous phase, meet at an angle and droplets are generated. Typically, the continuous flow rate is higher than the disperse flow rate. The nozzle size and the ratio of sample (disperse phase) to oil (continuous phase) define the size of the droplets, while flow rates of sample and oil phase define the throughput of the system.



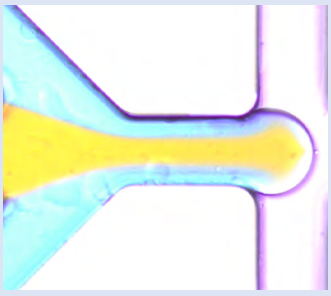
Droplet generator with single cross geometry and its working principle for water in oil droplets



Droplet generation (water in oil) at single cross flow focusing geometry of Fluidic 440



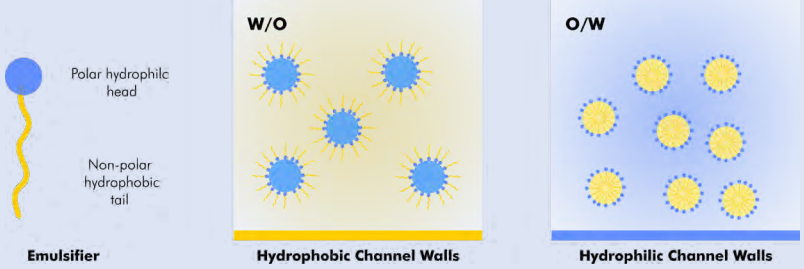
Droplet generator with double cross geometry and its working principle for water+water in oil



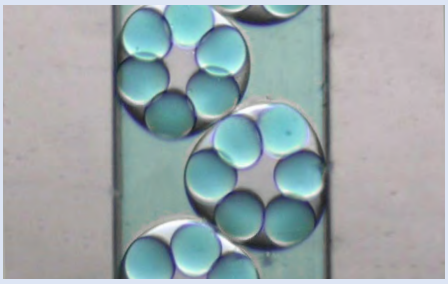
Droplet generation (water/water in oil) at double cross geometry of Fluidic 163

In order to increase the stability of the generated emulsion, emulsifiers can be used. An emulsifier is a substance that stabilizes an emulsion by increasing kinetic stability. One class of emulsifiers is known as "surface active agents" or "**surfactants**" that typically have a hydrophilic and a hydrophobic part. Surfactants have a large say in the configuration of droplets and prevent droplet coalition. Attention should also be paid to the channel surface wettability, i.e. to produce water in oil (W/O) droplets the microfluidic channel should have a hydrophobic surface. As the majority of droplet experiments in microfluidics are based on W/O, *microfluidic ChipShop*'s droplet generators possess a hydrophobic surface.

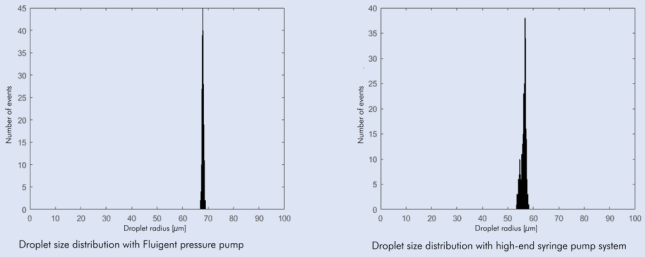
Beside the droplet generator, an appropriate **pump system** is needed for your successful droplet generation experiment. Highly monodisperse droplets (see bottom graphs) can be generated with pressure-controlled pumps as well as with high-end syringe pumps.The quality of your droplets is a function of the microfluidic chip, its design, the reagents, in particular the surfactants, the pumping system and your experimental setup. Despite having many influencing factor, droplet generation on chip is an easy task and you will have immediate success. Promise.



Principle of droplet formation with the help of an emulsifier to produce water in oil (W/O) and oil in water (O/W) droplets. Please pay attention to recommended surface wetting of microfluidic channel walls.



W/O/W (water in oil in water) droplets made possible through emulsifiers, i.e. surfactant in the oil phase



Droplet size distribution with Fluigent pressure pump

Droplet size distribution with high-end syringe pump system

Monodispersity comparison of W/O droplets generated with different pump systems at the same flowrates for disperse phase and continuous phase. Droplet Generator Fluidic 162 was used with both setups.

Experimental Setup - Overview

Successful droplet generation does not require much! Here is what you need for droplet generation experiments on chip:

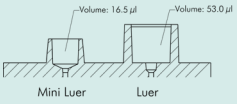
1. Microfluidic droplet generation chip
2. Fluidic accessories like
    a. Fluidic interfaces: e.g. Mini Luer or Luer fluid connectors
    b. Tubing
    c. Soft tubes (silicone) as sleevs
    d. Adapter frame for convenient handling
3. Reagents
    a. Oil
    b. Surfactant
4. Pump setup

Chip Summary

microfluidic ChipShop offers a multitude of droplet generator chips in microscope slide format. The chips vary greatly in design and complexity. The following design features should be considered when choosing the appropriate chip for your successful droplet experiment:

Interface type

All droplet generator chips either possess Mini Luer or Luer interfaces for a convenient connection of the chip with an appropriate pump system. Please ensure that you choose the adequate connectors and plugs when setting up your droplet generation experiment.

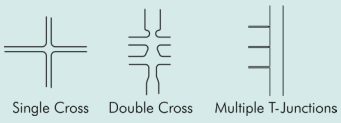


Nozzle size

Along with flowrates and the collection channel proportion, the dimension of the droplet creating cross junction is defining the droplet size. *microfluidic ChipShop* offers nozzle sizes as small as 10 µm up to 140 µm.

Nozzle geometry

At *microfluidic ChipShop* various channel geometies at the droplet generating side are available to enable a wide variety of options for your droplet generation experiments.

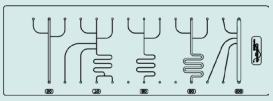


Droplet generator units per chip

One microfluidic chip in the size of a microscope slide can contain several droplet generator units. Chips with one to eight units are featured in *microfluidic ChipShop*'s portfolio.

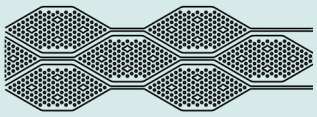
Geometries per chip

A microfluidic chip containing several droplet generator units can either feature the same unit design multiple times or nozzel size and geometry are varied to offer a greater flexibility in the evaluation of droplet generation.



Storage option

Droplet generators with storage option enable generation of droplets and storage/ capture of single droplets for optical analysis on the same device.



All chips are available in two materials, Topas and PC. Please be aware of material compatibility when setting up your droplet generation experiment. When utilizing silicone-based oils we recommend the use of Topas chips, while mineral oils require chips made from PC.

A comprehensive overview of droplet generators available at *microfluidic ChipShop* can be found in the below table.

Fluidic Design	Interface Type	Nozzle Sizes [µm]	Single Cross	Double-Cross	Generator Units /Chip	Droplet Storage
162	Mini Luer	70	Yes	Yes	1	No
163	Mini Luer	140	Yes	Yes	1	No
285	Mini Luer	50; 70; 80; 100	Yes	No	5	No
440	Mini Luer	50; 60; 70; 80	Yes	No	8	No
488	Mini Luer	74	Yes	Yes	1	Yes
536	Luer	38	Yes	Yes	3	No
537	Luer	38	Yes	No	4	No
719	Mini Luer	82	Yes	Yes	1	Yes
912	Mini Luer	80	Yes	No	8	No
947	Mini Luer	10; 15; 20; 30	Yes	No	8	No
1032	Mini Luer	100	Yes	Yes	3	No

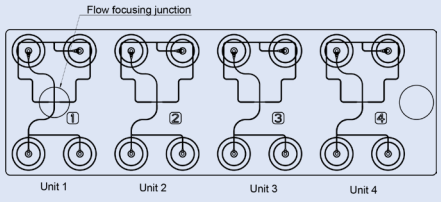
Fluidic 537 - Single Cross Geometry

The droplet generator with design number 537 possesses a classic flow focusing geometry, perfectly suited to generate simple droplets. With four identical droplet generator units on one microfluidic chip, this device is ideal for anyone who wants to try or compare multiple experimental setups, without the need of ordering a new chip for every experiment. Please be aware that this chip is one of the few droplet generators devices with Luer interfaces and appropriate Luer compatible accessories are required.

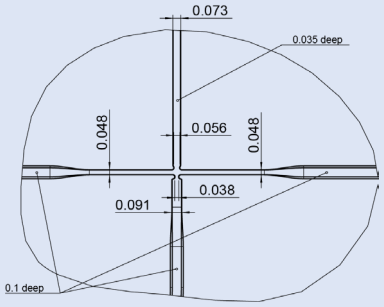
Chip Summary Fluidic 537

Interface type: Luer
Nozzle size: 38 µm
Nozzle type: single cross, flow focusing
Droplet generator units on chip: 4
Droplet storage: no

One functional droplet unit of Fluidic 537 with Luer fluid connectors (green) to facilitate connection to a pump/collection reservoir via tubing and a Luer plug (black) to close surplus interface



Schematic drawing of droplet generating chip Fluidic 537 with four identical droplet generation units on one chip



Detailed schematic drawing of the flow focusing region of Fluidic 537

Product Code for Fluidic 537	Lid Thickness [µm]	Material
10000466	140	Topas
10000467	175	PC

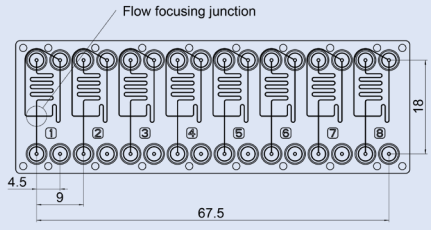
Fluidic 912 - Single Cross Geometry

Droplet generator chips Fluidic 912 provides eight identical droplet generator units with a nozzle size of 80 µm on one chip. The continuous phase is introduced through one Mini Luer inlet, which separates into two channels. Operation of one unit of Fluidic 912 therefore requires a microfluidic pump with the ability to control two individual flows, one for the continuous and one for the disperse phase.

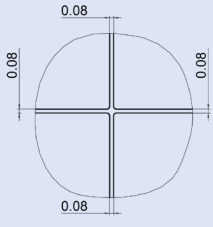
Chip Summary Fluidic 912

Interface type: Mini Luer
Nozzle size: 80 µm
Nozzle type: single cross, flow focusing
Droplet generator units on chip: 8
Droplet storage: no

Droplet generation chip Fluidic 912 with Mini Luer interfaces and matching Mini Luer connectors (blue) interfacing the one droplet generation unit



Schematic drawing of droplet generating chip Fluidic 912 with eight identical droplet generation units on one chip



Detailed schematic drawing of the flow focusing region of Fluidic 912

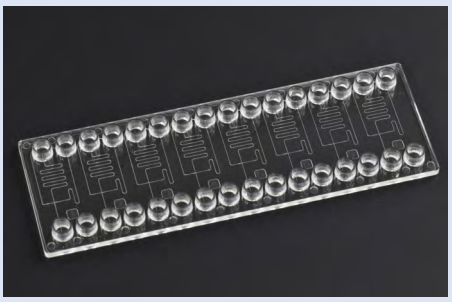
Product Code for Fluidic 912	Lid Thickness [µm]	Material
10001332	140	Topas
10001333	175	PC

Fluidic 947 - Single Cross Geometry - Multiple Nozzle Sizes

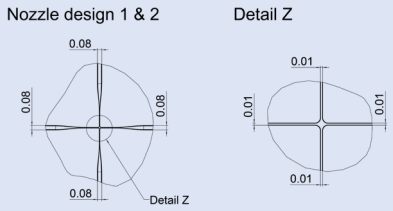
The microfluidic chip Fluidic 947 features eight flow focusing droplet generator units to evaluate the formation of various droplet sizes. With nozzle sizes as little as 10 µm, Fluidic 947 possesses the smallest nozzles within *microfluidic ChipShop*'s droplet generator portfolio. It is therefore the perfect chip for experiments that require droplets with particularly small dimensions and volumes.
The inlet channels for both continuous and disperse phase are designed to enable stable droplet generation through a certain degree of flow restriction.

Chip Summary Fluidic 947

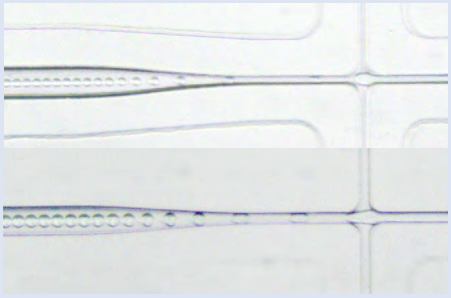
Interface type: Mini Luer
Nozzle size: 10; 15; 20; 30 µm
Nozzle type: single cross; flow focusing
Droplet generator units on chip: 8
Droplet storage: no



Chip layout of Fluidic 947. The chip with eight functional droplet generation units shares its general layout with its larger siblings Fluidic 912 and Fluidic 440.



Detailed schematic drawing of the smallest droplet generation units 1 & 2 of Fluidic 947



Droplets generated using Fluidic 947 with nozzle size 20 µm (top) and nozzle size 30 µm (bottom). Pressures applied to continuous phase were 110 mbar (20 µm nozzle) and 90 mbar (30 µm nozzle). Pressure applied to disperse phase was ~140 mbar in both cases.

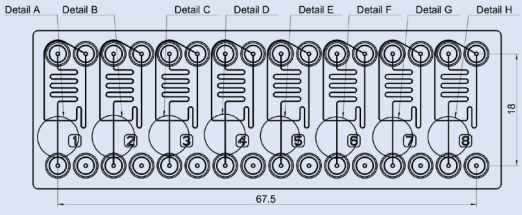
Product Code for Fluidic 947	Lid Thickness [µm]	Material
10001336	140	Topas

Fluidic 440 - Single Cross Geometry - Multiple Nozzle Sizes

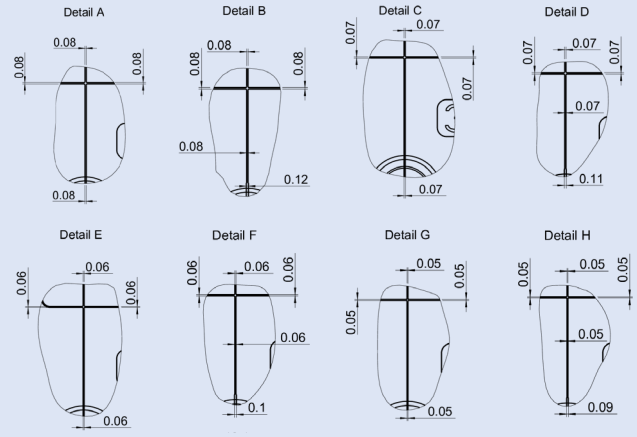
Being the larger sibling of Fluidic 947, the droplet generator chip Fluidic 440 is also perfectly suited to evaluate droplet generation with a single cross, flow focusing geometry. The nozzle sizes, however, range from 50 µm to 80 µm on this chip. With its two Mini Luer inlet and one Mini Luer outlet ports per droplet generation unit, the chip requires a two-channel microfluidic pump, just as Fluidic 912 and Fluidic 947.

Chip Summary Fluidic 440

Interface type: Mini Luer
Nozzle size: 50; 60; 70; 80 µm
Nozzle type: single cross; flow focusing
Droplet generator units on chip: 8
Droplet storage: no



Schematic drawing of droplet generating chip Fluidic 440 with eight different droplet generation units on one chip



Detailed schematic drawings for each of the eight individual droplet generator units of Fluidic 440

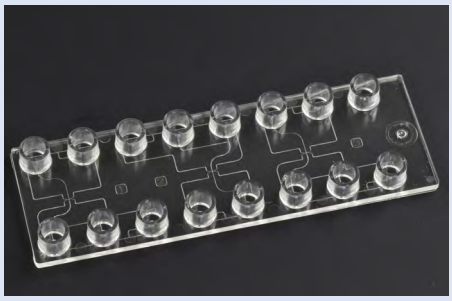
Product Code for Fluidic 440	Lid Thickness [µm]	Material
10000040	140	Topas
10000174	175	PC

Fluidic 536 - Double Cross Geometry

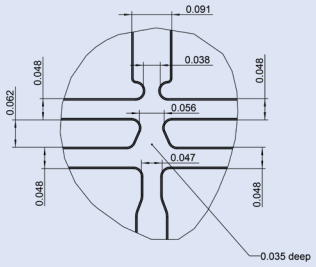
Droplet generator chips with a double cross geometry allow for the generation of W/W/O droplets and are therefore ideally suited for the inclusion of particles or cells, deriving from the first channel intersection, with a further droplet shell at the second channel intersection. With 38 µm nozzle diameter, Fluidic 536 offers the smallest nozzle size with double cross geometry within *microfluidic ChipShop*'s portfolio. Please be aware of the chip's Luer interfaces, which require dedicated Luer-sized connectors and plugs.

Chip Summary Fluidic 536

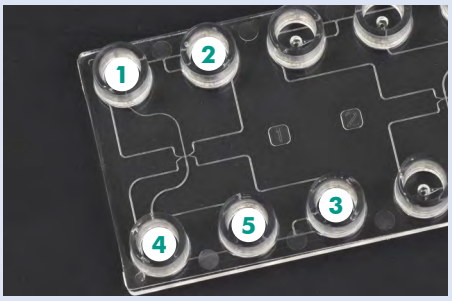
Interface type: Luer
Nozzle size: 38 µm
Nozzle type: double cross, flow focusing
Droplet generator units on chip: 3
Droplet storage: no



Fluidic 536 with three functional droplet generation units on one chip



Detailed schematic drawing of the droplet generation area of Fluidic 536



One droplet generation unit of Fluidic 536 with Luer inlets for aqueous disperse phases (1 & 2), continous oil phase (3) and outlets (4 & 5)

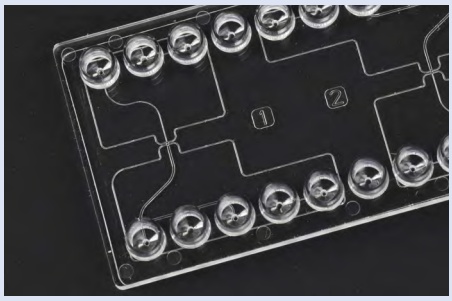
Product Code for Fluidic 536	Lid Thickness [µm]	Material
10000433	140	Topas
10000509	175	PC

Fluidic 1032 - Double Cross Geometry

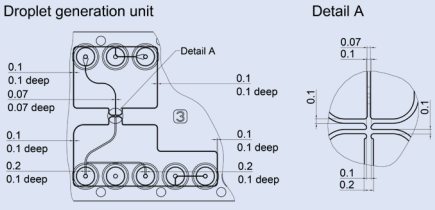
This droplet generator chip with three identical droplet generation units of double cross geometry was specifically developed for use in single cell sequencing experiments, where single cells (W) and beads/lysis buffer (W) need to be introduced into a single droplet in an oil phase (O). Fluidic 1032 features Mini Luer interfaces and its use requires a microfluidic pump setup with the ability to control three individual flows. It is, however, also possible to use this droplet generator to generate W/O droplets by simply closing one inlet and supplying only two inlets with a liquid stream.

Chip Summary Fluidic 1032

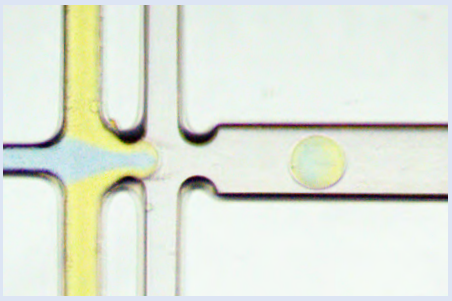
Interface type: Mini Luer
Nozzle size: 100 µm
Nozzle type: double cross, flow focusing
Droplet generator units on chip: 3
Droplet storage: no



One of the tree identical droplet generation units on Fluidic 1032 with Mini Luer interfaces



Schematic drawing of one droplet generation unit on Fluidic 1032 (left) and a detailed view on the droplet generating intersection (right)



W/W/O droplets with a diameter of 180 µm were generated by applying pressures of 12 mbar / 72 mbar / 99 mbar respectively.

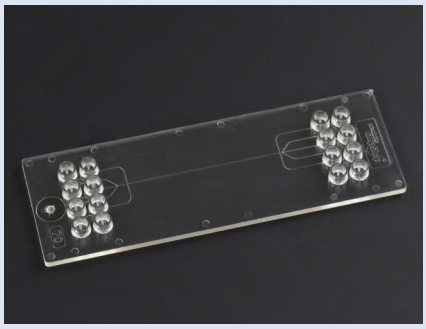
Product Code for Fluidic 1032	Lid Thickness [µm]	Material
10001334	140	Topas
10001335	175	PC

Fluidic 162 - Double Cross Geometry

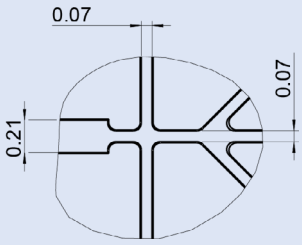
Droplet generator Fluidic 162 features a double channel crossing in the droplet generation region and one droplet collection channel. Like most droplet generators with a double cross geometry, Fluidic 162 can also be used for single cross experiments by simply not connecting respective channels but closing their interfaces with plugs. With a nozzle size of 70 µm droplet sizes between 80 µm (~260 pl) and 210 µm diameter can be realized. A constant droplet size can be generated in various flow speeds by preserving the oil to aqueous phase ratio. By increasing the oil phase flow rate at a constant aqueous flow rate, the droplet size can be varied.

Chip Summary Fluidic 162

Interface type: Mini Luer
Nozzle size: 70 µm
Nozzle type: double cross; flow focusing
Droplet generator units on chip: 1
Droplet storage: no



General channel design of Fluidic 162 and Fluidic 163 is identical except for the exact channel dimensions



Schematic drawing of double cross geometry at the droplet generating region of Fluidic 162

Product Code for Fluidic 162	Input Channel Width [µm]	Collection Channel Width [µm]	Channel Depth [µm]	Lid Thickness [µm]	Material
10000005	70	210	140	140	Topas
10000003	70	210	140	175	PC

Fluidic 163 - Double Cross Geometry

Droplet generator Fluidic 163 is the larger sibling of Fluidic 162 and features a similar design with larger channel dimensions. With a nozzle size of 140 µm droplet sizes between 190 µm (~3.25 nl) and 420 µm diameter can be realized. Fluidic 163 gives the possibility to be utilized from two sides, as it features droplet generation crossings at either side of the collection channel. Both sides are similar in channel design with a slight difference in distance of the double cross intersections.

Chip Summary Fluidic 163

Interface type: Mini Luer
Nozzle size: 140 µm
Nozzle type: double cross; flow focusing
Droplet generator units on chip: 1
Droplet storage: no

Detailed inlet and channel design of Fluidic 163

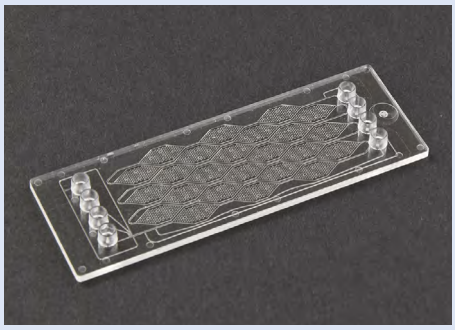
10000006	140	420	140	140	Topas
10000004	140	420	140	175	PC

Fluidic 488 - Droplet Generation and Storage

Droplet generation and storage chip Fluidic 488 was specifically designed to generate and capture droplets for on-chip optical analysis of generated single droplets. It features 24 rhombic storage units, each suitable to capture 108 individual droplets. With a combination of multiple T-junctions and a flow focusing nozzle, the channel design in the droplet generating area is a versatile tool for many different experimental settings.

Chip Summary Fluidic 488

Interface type: Mini Luer
Nozzle size: 74 µm
Nozzle type: double cross
Droplet generator units on chip: 1
Droplet storage: yes



Droplet generation and storage chip Fluidic 488 with multiple droplet storing units

Product Code for Fluidic 488	Lid Thickness [µm]	Material
10000510	140	Topas
10000511	175	PC

Fluidic 719 - Droplet Generation and Storage

Fluidic 719 possesses a storage channel design, which is suited to be used for optical analysis. Both droplet generator region and individual storage cavities are fairly similar to the ones of Fluidic 488. However, the channel design of Fluidic 719 adds an additional flow focusing junction and droplet storage is realized in one channel, rather than in rhombic units. The chip contains 2261 storage positions and can be used for a wide-range of applications including droplet-based cell culture/monitoring.

Chip Summary Fluidic 719

Interface type: Mini Luer
Nozzle size: 82 µm
Nozzle type: double cross
Droplet generator units on chip: 1
Droplet storage: yes

Droplet generation and storage chip Fluidic 719 possesses a complex nozzle geometry and channel with over 2000 droplet storage positions

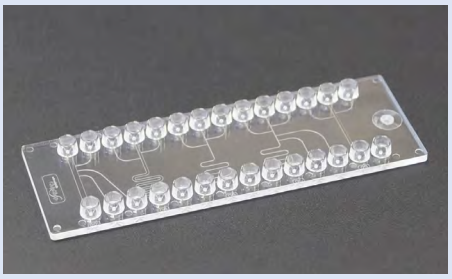
Product Code for Fluidic 719	Lid Thickness [µm]	Material
10000751	140	Topas
10000752	175	PC

Fluidic 285 - Various Channel Designs on one Chip

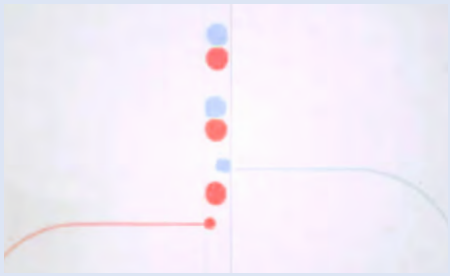
Fluidic 285 is a true playground for anyone who wants to start with droplet generation and requires a microfluidic chip with various different droplet generation units. The chip features five different droplet generation units with multiple channel designs and sizes, enabling a large set of experiments. Channels/ports not in use can easily be closed by means of Mini Luer plugs.

Chip Summary Fluidic 285

Interface type: Mini Luer
Nozzle size: 50; 70; 80; 100 µm
Nozzle type: various
Droplet generator units on chip: 5
Droplet storage: no



Droplet generation chip 285 features a variety of nozzle designs



Droplet generation using Fluidic 285 and its design unit 1 (Detail A)

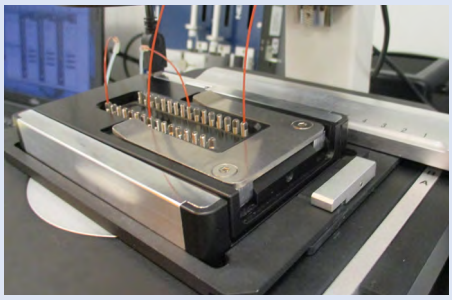
10000176	175	PC

Accessories - Lab-on-a-Chip Handling Platform

microfluidic ChipShop's handy Lab-on-a-Chip Handling Platform (LOC HP) is a versatile device to enable quick and easy fluidic interface connection. The LOC HP can be obtained with adapter plates for three microfluidic interface configurations: two interface configurations with the fluidic interfaces at the shorter sides of the microfluidic chip and one at the longer sides, addressing openings with a 4.5 mm spacing. With this, the LOC HP is compatible with all our off-the-shelf droplet generator chips with Mini Luer interfaces. A heatable version for cell culture experiments is also available.

The complete setup of a LOC CCI 1 with heating elements. In contrast, the LOC HP does not include temperature control units.

LOC HP with interchangeable adapter plates to fit with all off-the-shelf droplet generators with Mini Luer interfaces.



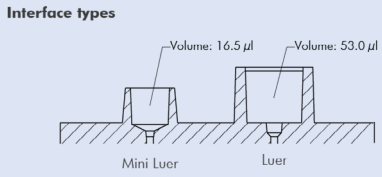
Possesing microtiter plate format, the LOC HP fits in stanard micro-scope stages. PEEK tubing of 1/32" (red) is use in with the platform.

Product Code	Description
10000287	LOC HP w/o heating elements (incl. 1 adapter plate of your choice)
10000743	LOC CCI 1 with heating elements (incl. 1 adapter plate of your choice)
10001216	Additional adapter plate

Accessories - Connectors, Plugs and Tubing

Connectors: *microfluidic ChipShop* offers a multitude of connectors, facilitating fast and convenient connection of droplet generation chips with e.g. pumps, valves or collection reservoirs via tubing. All connectors are designed to fit standard microfluidic interfaces, such as Luer and Mini Luer, while retaining a minimum dead volume. Please always double-check the interface type (Luer or Mini Luer) of your droplet generator and obtain connectors and plugs accordingly.

Plugs: Oftentimes, our droplet generators possess surplus in- and outlet to ensure maximal experimental freedom. However, not in every experimental setting all interfaces need to be addressed. Mini Luer plugs and Luer plugs are the dedicated mean to securely close fluidic interfaces on your droplet generation chip, which are not in use.



Comparison of Mini Luer and Luer interfaces, booth of which can be found on *microfluidic ChipShop*'s droplet generator chips. If used in suction rather than in pumping mode, interfaces can also serve as liquid reservoirs

Male Luer fluid connectors (green) and a Male Luer plug (black) being utilized on Fluidic 537

Droplet generator Fluidic 163 with tubes connected via Male Mini Luer fluid connectors to facilitate monodisperse water in oil droplets

Product Code	Fluidic	Description	Color	Material
10000064	331	Male Mini Luer fluid connector	Red*	PP
10000116	331	Male Mini Luer fluid connector	Opaque	TPE

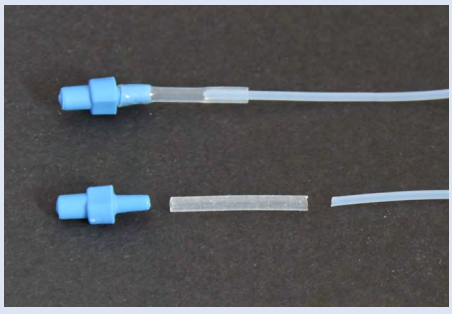
10000081	263	Male Luer fluid connector	Green	PP
10000231	270	Male Luer plug	Black*	PP

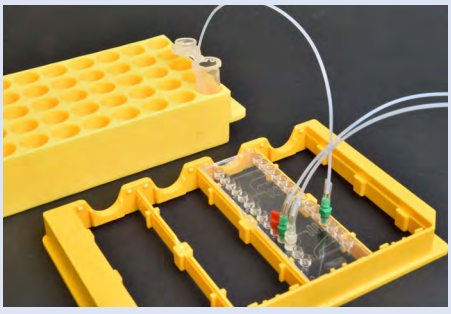
* other colors and options available

Tubing: Tubing is needed in most cases to link the droplet generator chip with an external pump, which drives removal or delivery of liquid. For most droplet applications *microfluidic ChipShop* recommends the use of PTFE tubing in combination with a silicone sleeve, prepared from soft silicone tubing. Soft silicone sleeves are the perfect interconnection of relatively hard PTFE tubing with the Mini Luer or Luer fluid connectors. Silicone sleeves are cut from longer silicone tubes.

Handling Frames: For secure handling and positioning of chips we offer dedicated handling frames into which microfluidic chips can be easily clicked in.



Assembly of Mini Luer fluid connector, silicone sleeve (from product 10000031) and PTFE tubing



Fluidic 285, securely placed in a handling frame, is used to generate W/O droplets. Generated droplets are collected in a nearby Eppendorf tube

Product Code	Description
10000032	PTFE Micro tubes, ID: 0.5 mm, OD: 1.0 mm
10000031	Silicone tube, ID: 0.76 mm, OD: 1.65 mm
10000033	Silicone tube, ID: 0.5 mm, OD: 2.5 mm
10000041	Handling frame with reduced skirt height (orange)*

* other colors and options available

Did you know?
It's all about the right cut

Attaching silicone sleeves to fluid connectors can be a bit tricky. Cut the silicone tube in a slight angle and it will work a lot easier.

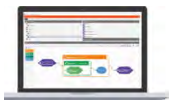
Droplet Generation - Pressure-Driven Pump System

Together with our partner **Fluigent,** we offer everything you require for a droplet experiment with two flow channels of a **pressure-driven pump**. This setup is ideal to create droplets with e.g. a single cross, flow focusing droplet generator. Here is what your droplet generation setup will contain:

Microfluidic Pressure Pumps - LineUp Flow EZ™:
- Highly advanced system for pressure-based flow control
- Stand-alone units for use near the microfluidic setup
- Independent control flows of disperse and continuous phases
- Available in a variety of pressure ranges from - 800 to + 7 000 mbar

LINK:
- Provides connection of LineUp Flow EZ™ series modules to a PC for software control

Flow Units:
- Flow sensors that allows real-time flow rate measurements
- Enables to switch from pressure control to flow rate control
- Guarantee reproducibility of long-term droplet production



All-in-One (A-i-O) control software:
- Real-time control of pressures and flow rates
- Modular interface
- Independent monitoring of all parameters for each connected channel

Product	Content
Fluigent pump setup for droplet generation with two individual flow channels	LineUP Flow EZ™ modules (2x), LineUP LINK module, LineUP power supply kit, Pressure CAP for 15 ml tubes (2x) with support rack (1x), Flow Unit S (0-7µL/min for water or 0-70µL/min for hydrocarbons) (2x), A-I-O software, Droplet generation - Droplet variation kit (product code 10001653)

Droplet Kit and Droplet Oil

Our droplet kit is the perfect way to start your droplet-based experiment without further ado. The droplet variation kit contains everything needed to generate W/O droplets of multiple sizes and in various settings. The kit will help you to determine your optimal experimental layout, without the need for extensive background research. The provided items are perfectly suited to be used with a Fluigent pump setup or a high-end syringe pump, both available with *microfluidic ChipShop*.

The Droplet generation - Droplet variation kit is suitable for generating W/O droplets of different sizes and in a variety of settings
